CLAIMS

1. (Currently Amended) A shield cable comprising:

~~one or more~~ two insulated wires, having diameters not more than 0.3 mm, ~~that are~~ and covered with a shield conductor and a sheath,

each of said ~~one or more~~ insulated wires comprising a signal conductor covered with an insulator,

said shield conductor consisting of a plurality of shield layers, wherein

a first shield layer constituting the innermost layer of said plurality of shield layers consists of a plurality of conductors spirally wound at a pitch of 7 to 13 mm; and.

said sheath and said plurality of shield layers integrally cover said insulated wires.

2. (Cancelled).

3. (Previously Presented) A shield cable according to claim 1, wherein

a second shield layer is formed by spirally winding a plurality of conductors on said first shield layer in a counter winding direction relative to that of said first shield layer.

4. (Previously Presented) A shield cable according to claim 1, wherein

a second shield layer is formed by winding a plurality of conductors on said first shield layer spirally in the same winding direction as that of said first shield layer.

5. (Previously Presented) A shield cable according to Claim 3, wherein

a scroll pitch of said second shield layer is not more than a scroll pitch of said first shield layer.

6. (Previously Presented) A wiring component in which a plurality of shield cables according to claim 1 are bundled and a connecting terminal portion is provided at least at one end of said wiring component.

7. (Previously Presented) An information apparatus having a shield cable according to claim 1, said shield cable being used for a signal wiring to pass through a hinged portion of said information apparatus.

8. (Original) An information apparatus having a wiring component according to claim 6, said wiring component being used for a signal wiring to pass through a hinged portion of said information apparatus.
